## ANTS-FT \# 21 (Engineering Dropper) (Solutions) - 2019-20

1. In the shown system, $\mathrm{m}_{1}>\mathrm{m}_{2}$. Thread QR is holding the system. If this thread is cut, then just after cutting.

(A) acceleration of mass $m_{1}$ is zero and that of $m_{2}$ is directed upward
(B) acceleration of mass $m_{2}$ is zero and that of $m_{1}$ is directed downward
(C) acceleration of both the blocks will be same
(D) acceleration of system is given by $k\left(\frac{m_{1}-m_{2}}{m_{1}+m_{2}}\right)$ g, constant.

## Solution :

On cutting the string $Q R$, the resultant force on $m_{1}$ remains zero because its weight $m_{1} g$ is balanced by the tension in the spring but on block $m_{2}$ a resultant upward force $\left(m_{1}-m_{2}\right) g$ is developed. Thus block $m_{1}$ will have no resultant acceleration whereas $m_{2}$ does have an upward acceleration given by $\frac{\left(m_{1}-m_{2}\right) g}{m_{2}}$.
Hence the answer is (A).
2. Two balls of mass $\mathrm{M}=9 \mathrm{~g}$ and $\mathrm{m}=3 \mathrm{~g}$ are attached by massless threads AO and OB . The length AB is 1 m . They are set in rotational motion in a horizontal plane about a vertical axis at O with constant angular velocity $\omega$. The ratio of length AO and OB $\left(\frac{A O}{O B}\right)$ for which the tension in threads are same will be

(A) $\frac{1}{3}$
(B) 3
(C) $\frac{2}{3}$
(D) $\frac{3}{2}$

## Solution :

$$
\begin{aligned}
& T_{1}=T_{2} \\
& \Rightarrow M \omega^{2} x=m \omega^{2}(I-x) \\
& \quad x=\frac{m l}{M+m}
\end{aligned}
$$

$$
\frac{A O}{O B}=\frac{x}{1-x}=\frac{m}{M}=\frac{3}{9}=\frac{1}{3}
$$

## Hence the answer is ( A ).

## ANTS-FT \# 21 (Engineering Dropper) (Solutions) - 2019-20

3. A constant power is supplied to a rotating disc. Angular velocity ( $\omega$ ) of disc varies with number of rotations ( $n$ ) made by the disc as
(A) $\omega \propto n^{1 / 3}$
(B) $\omega \propto n^{3 / 2}$
(C) $\omega \propto n^{2 / 3}$
(D) $\omega \propto n^{2}$

## Solution :

Since, $P=\tau \omega=$ constant $\Rightarrow \alpha \omega=c$ (constant)

$$
\begin{aligned}
& \Rightarrow \quad \omega^{2} \frac{\mathrm{~d} \omega}{\mathrm{~d} \theta}=\mathrm{c} \quad \Rightarrow \quad \omega \propto \theta^{1 / 3} \\
& \therefore \quad \omega \propto n^{1 / 3}(\text { as } \theta \propto n)
\end{aligned}
$$

Hence the answer is (A).
4. A ring of mass $m$ is placed on a very rough horizontal surface with its plane vertical. A horizontal impulse $J$ is applied on the ring of mass $m$ along a line passing through its centre. The linear velocity of the centre of the ring once it starts pure rolling is
(A) $\frac{\mathrm{J}}{\mathrm{m}}$
(B) $\frac{\mathrm{J}}{2 \mathrm{~m}}$
(C) $\frac{2 \mathrm{~J}}{\mathrm{~m}}$
(D) $\frac{\mathrm{J}}{3 \mathrm{~m}}$

## Solution :

Let $v$ be the velocity of centre of mass of ring just after the impulse is applied and $v$ is its velocity in pure rolling.
$v_{0}=\frac{\mathrm{J}}{\mathrm{m}}$

Conserving angular momentum about point of contact with ground

$$
m v_{0} r=m v r+I_{c m} \omega
$$

$\Rightarrow \quad v=\frac{v_{0}}{2}=\frac{\mathrm{J}}{2 \mathrm{~m}}$

## Hence the answer is (B).

5. A spring-block system is kept on a smooth wedge of inclination $\theta$ as shown in figure. The mass of the block is m , spring constant of the spring is k . (A) $2 \pi \sqrt{\frac{m}{k \sin \theta}}$
(B) $2 \pi \sqrt{\frac{m}{k \sin ^{2} \theta}}$
(C) $2 \pi \sqrt{\frac{\mathrm{~m} \sin \theta}{\mathrm{k}}}$
(D) $2 \pi \sqrt{\frac{\mathrm{~m}}{\mathrm{k}}}$

## Solution :

Time period of spring block system does not depend on the effective $g$

## Hence the answer is (D).

(D) $\frac{4 \pi}{5}$

## Solution :

$\omega=\frac{5}{2} \mathrm{radian} / \mathrm{sec}, \mathrm{T}=\frac{2 \pi}{\omega}=\frac{4 \pi}{5}$
Hence the answer is (D).

(D) $\frac{\sqrt{3} \lambda a}{\varepsilon_{0}}$

## Solution :

The maximum length of the string which can fit into the cube is $\sqrt{3} a$, equal to its body diagonal. The maximum charge inside the cube is , and hence the maximum flux through the cube is $\frac{\sqrt{3} \lambda a}{\varepsilon_{0}}$

## Hence the answer is (D).

## Solution :

$\mathrm{K}_{\mathrm{b}}=\frac{\mathrm{K}_{\mathrm{w}}}{\mathrm{K}_{\mathrm{a}}}=\frac{10^{-14}}{5 \times 10^{-10}}=2 \times 10^{-5}$
$\therefore\left[\mathrm{OH}^{-}\right]=\sqrt{2 \times 10^{-5} \times 5.82}=1.07 \times 10^{-2} \mathrm{M}$
$\therefore\left[\mathrm{H}^{+}\right]=\frac{10^{-14}}{1.07 \times 10^{-2}}=0.93 \times 10^{-12} \mathrm{M}$

47. One mole of a mixture of CO and $\mathrm{CO}_{2}$ requires exactly 20 gm of NaOH in solution for complete conversion of all the $\mathrm{CO}_{2}$ into sodium carbonate. How much NaOH in grams would it require for conversion into $\mathrm{Na}_{2} \mathrm{CO}_{3}$, if the mixture (one mole) is completely oxidised to the $\mathrm{CO}_{2}$ ?

## Solution :

$2 \mathrm{NaOH}+\mathrm{CO}_{2} \longrightarrow \mathrm{Na}_{2} \mathrm{CO}_{3}+\mathrm{H}_{2} \mathrm{O}$
$\because \frac{1}{2} \times$ moles of NaOH used $=$ moles of $\mathrm{CO}_{2}$
$\therefore$ moles of $\mathrm{CO}_{2}$ in mixture $=\frac{1}{2} \times \frac{20}{40}=\frac{1}{4}$
Mole of CO in mixture $=1-\frac{1}{4}=\frac{3}{4}$
If this CO is completely oxidised to $\mathrm{CO}_{2}$ then moles of $\mathrm{CO}_{2}$ formed $=\frac{3}{4}$
Total moles of $\mathrm{CO}_{2}=\frac{1}{4}+\frac{3}{4}=1$
Moles of NaOH required $=2 \times$ moles of $\mathrm{CO}_{2}=2 \times 1=2$ moles
$\therefore$ mass of NaOH required $=2 \times 40=80 \mathrm{gm}$
Hence the answer is (80).

## Solution :

$\mathrm{Zn}+\mathrm{Cu}^{2+} \longrightarrow \mathrm{Zn}^{2+}+\mathrm{Cu}$
$\because$ meq. $=\mathrm{N} \times \mathrm{V}(\mathrm{ml})$
meq. of $\mathrm{Cu}^{2+}$ lost $=$ meq. of $\mathrm{Cu}^{2+}$ before reaction - meq. of $\mathrm{Cu}^{2+}$ after reaction.

$$
=(1000 \times 1 \times 2)-(100 \times 0.8 \times 2)=40
$$

$\therefore$ meq. of $\mathrm{Cu}^{2+}$ lost $=$ meq. of Zn lost $=40$
$\frac{W}{E} \times 1000=\frac{W}{65.4 / 2} \times 1000=40 \Rightarrow W=1.3 \mathrm{gm}$
$\therefore$ Net mass of Zn rod $=25-1.3=23.7 \mathrm{gm}$
Hence the answer is (23.7).

(C) $y=\frac{1}{-A(x-1)+1}$
(D) none of these

## Solution :

$\frac{y^{\prime \prime}}{y^{\prime}}=\frac{2 y^{\prime}}{y}$, on integrating, we get $\ln y^{\prime}=2 \ln y+c$ so $y^{\prime}=A y^{2}$
Again integration, we get $-\frac{1}{y}=A x+B$

$\Rightarrow\left(1-\frac{\alpha(\beta+1)}{\alpha+1}\right) \overline{\mathrm{a}}+\overline{\mathrm{b}}+\overline{\mathrm{c}}=0$
Which is a contradiction
$\because \overline{\mathrm{a}}, \overline{\mathrm{b}}, \overline{\mathrm{c}}$ are non-coplanar

## Solution :

$\Rightarrow(2 \cos \theta \overline{\mathrm{a}}-\overline{\mathrm{c}})^{2}=1(\overline{\mathrm{a}} \cdot \overline{\mathrm{c}}=(1)(2) \cos \theta)$

## Solution :

Component of $\bar{a} \times(\bar{b} \times \bar{c})$ along $\bar{b}$ is $\left(\left(\frac{(\bar{a} \cdot \bar{c}) \overline{\mathrm{b}}-(\overline{\mathrm{a}} \cdot \overline{\mathrm{b}}) \overline{\mathrm{c}}}{|\mathrm{b}|^{2}}\right) \cdot \overline{\mathrm{b}}\right) \overline{\mathrm{b}}$
So component of $\bar{a} \times(\bar{b} \times \bar{c})$ perpendicular to $\bar{b}$ is $\bar{a} \times(\bar{b} \times \bar{c})-\left(\frac{(\bar{a} \cdot \bar{b})(\bar{b} \cdot \bar{c})-(\bar{a} \cdot \bar{c})(\bar{b} \cdot \bar{b})}{|b|^{2}}\right) \bar{b}$

## Solution :

$I=\int \frac{\left(\cos ^{2} x+\cos ^{4} x\right) \cdot \cos x d x}{\sin ^{2} x+\sin ^{4} x}=\int \frac{1-t^{2}+\left(1-t^{2}\right)^{2}}{t^{2}+t^{4}} d t$
$=\int \frac{\left(1-t^{2}\right)\left(2-t^{2}\right)}{t^{2}\left(1+t^{2}\right)} d t=2 \int \frac{2-t^{2}}{1+t^{2}} d t-\int \frac{\left(2-t^{2}\right)}{t^{2}} d t$
$=6 \int\left(\mathrm{t}^{2}-\frac{1}{1+\mathrm{t}^{2}}\right) \mathrm{dt}-4 \int \frac{\mathrm{dt}}{\mathrm{t}^{2}}+\int \mathrm{dt}=2 \int \frac{\mathrm{dt}}{\mathrm{t}^{2}}-6 \int \frac{\mathrm{dt}}{1+\mathrm{t}^{2}}+\int \mathrm{dt}$
$=\frac{-2}{t}-6 \tan ^{-1}(t)+t+c=\sin x-2(\sin x)^{-1}-6 \quad \tan ^{-1}(\sin x)+c$
Hence the answer is (C).
69. If $A=\int_{1}^{\sin \theta} \frac{t d t}{1+t^{2}}$ and $B=\int_{1}^{\operatorname{cosec} \theta} \frac{d t}{t\left(1+t^{2}\right)}$, then the value of $\left|\begin{array}{ccc}A & A^{2} & B \\ e^{A} e^{B} & B^{2} & -1 \\ 1 & A^{2}+B^{2} & -1\end{array}\right|$ is
(A) $\sin \theta$
(B) $\operatorname{cosec} \theta$
(C) 0
(D) 1

## Solution :

$\mathrm{A}=\int_{1}^{\sin \theta} \frac{\mathrm{tdt}}{1+\mathrm{t}^{2}}$
Let $t=\frac{1}{x}, \quad d t=-\frac{1}{x^{2}} d x, \quad A=\int_{1}^{\operatorname{cossc} \theta} \frac{1}{x} \cdot \frac{-1}{x^{2}} \cdot \frac{d x}{\frac{x^{2}+1}{x^{2}}}=-\int_{1}^{\operatorname{cosec} \theta} \frac{d x}{x\left(1+x^{2}\right)}=-B$
$\therefore A+B=0$
$\Delta=\left|\begin{array}{ccc}A & A^{2} & B \\ e^{A+B} & B^{2} & -1 \\ 1 & A^{2}+B^{2} & -1\end{array}\right|=\left|\begin{array}{ccc}A & A^{2} & -A \\ 1 & A^{2} & -1 \\ 1 & 2 A^{2} & -1\end{array}\right|=0$
Hence the answer is ( C ).

70. If $z$ is a complex number satisfying $|z|^{2}-|z| \quad 2<0$, then the value of $\left|z^{2}+z \sin \theta\right|$, for all values of $\theta$, is
(A) equal to 4
(B) equal to 6
(C) more than 6
(D) less than 6

## Solution :

$|z|^{2}-|z|-2<0$
$\Rightarrow(|z|-2) \quad(|z|+1)<0 \Rightarrow|z|<2$
Now $\left|z^{2}+z \sin \theta\right| \leq|z|^{2}+|z \sin \theta| \leq|z|^{2}+|z|<4+2=6$
Hence the answer is (D).

71. Let $N$ be any four digit number say $x_{1} x_{2} x_{3} x_{4}$. Then maximum value of $\frac{N}{x_{1}+x_{2}+x_{3}+x_{4}}$ is equal to

## Solution :

$\frac{N}{x_{1}+x_{2}+x_{3}+x_{4}}=\frac{1000 x_{1}+100 x_{2}+10 x_{3}+x_{4}}{x_{1}+x_{2}+x_{3}+x_{4}}=1000-\frac{\left(900 x_{2}+990 x_{3}+999 x_{4}\right)}{\left(x_{1}+x_{2}+x_{3}+x_{4}\right)}$
$\Rightarrow$ Maximum value of $\frac{\mathrm{N}}{\mathrm{x}_{1}+\mathrm{x}_{2}+\mathrm{x}_{3}+\mathrm{x}_{4}}=1000$
Hence the answer is (1000).
72. The maximum value of $f(x)=\frac{x^{4}-x^{2}}{x^{6}+2 x^{3}-1}, x>1$ is

## Solution :

## Hence the answer is (0.167).

73. Jerry starts at 0 on the real number line. He tosses a fair coin 8 times. When he gets heads, he moves 1 unit in the positive direction; when he gets tails, he moves 1 unit in the negative direction. The probability that he reaches 4 at some time during this process $\frac{a}{b}$, where $a$ and $b$ are relatively prime positive integers. What is $\mathrm{a}+\mathrm{b}$ ? (For example, he succeeds if his sequence of tosses is H T H H H H H H)

## Solution :

For 6 to 8 heads, we are guaranteed to hit 4 heads, so the sum here is
$\binom{8}{2}+\binom{8}{1}+\binom{8}{0}=28+8+1=37$
For 4 heads, you have to hit the 4 heads at the start so there's only one way, 1.
For 5 heads, we either start of with 4 heads, which gives us $4 C 1=4$ ways to arrange the other flips, or we start off with five heads and one tail, which has 6 ways minus the 2 overlapping cases, HHHHHTTT and HHHHTHTT. Total ways 8.
Then we sum to get 46 . There are a total of $2^{8}=256$ possible sequences of 8 coin flips, so the probability is $\frac{46}{256}=\frac{23}{128}$. Summing, we get $23+128=151$
Hence the answer is (151).

74. $f(x)+f\left(1-\frac{1}{x}\right)=1+x$ for $x \in R-\{0,1\}$. The value of $f(2)$ is equal to

## Solution :

Let $\mathrm{y}=1-\frac{1}{\mathrm{x}}$
$f(y)+f\left(1-\frac{1}{y}\right)=f\left(1-\frac{1}{x}\right)+f\left(x-\frac{x}{x-1}\right)=f\left(1-\frac{1}{x}\right)+f\left(\frac{1}{1-x}\right)=2-\frac{1}{x}$
put $z=\frac{1}{1-x}$
$f(z)+f\left(1-\frac{1}{z}\right)=f\left(\frac{1}{1-x}\right)+f(x)=1+\frac{1}{1-x}$
subtract
$f(x)-f\left(1-\frac{1}{x}\right)=\frac{1}{1-x}+\frac{1}{x}-1$
$f(x)=\frac{1}{2}\left(\frac{1}{1-x}+\frac{1}{x}+x\right)$.

## Alternate:

Putting $x=2, \frac{1}{2}$ and -1 successively
$f(2)+f(1 / 2)=3$
$f(1 / 2)+f(-1)=3 / 2$
and $f(-1)+f(2)=0$
Solving, we get $f(2)=3 / 4$.
Hence the answer is (0.75).
75. If $f: R \rightarrow R$ is a function satisfying the property $f(2 x+3)+f(2 x+7)=2, \forall x \in R$, then the period of $f(x)$ is

## Solution :

$f(2 x+3)+f(2 x+7)=3$
Replace $x$ by $x+1, f(2 x+5)+f(2 x+9)=2$
Now replace $x$ by $x+2, f(2 x+7)+f(2 x+11)=2$
from (1) - (3) we get $f(2 x+3)-f(2 x+11)=0$
$f(2 x+3)=f(2 x+11) \Rightarrow T=4$.
Hence the answer is (4).
